

Assignment -4
Python Programming

Assignment Date	19 September 2022
Student Name	Ms. Subasri.D.R
Student Roll Number	820419104073
Maximum Marks	2 Marks

Question-1:

Consider a list (list = []). You can perform the following commands: insert i e: Insert integer at position . print: Print the list. remove e: Delete the first occurrence of integer . append e: Insert integer at the end of the list. sort: Sort the list. pop: Pop the last element from the list. reverse: Reverse the list. Initialize your list and read in the value of followed by lines of commands where each command will be of the types listed above. Iterate through each command in order and perform the corresponding operation on your list.

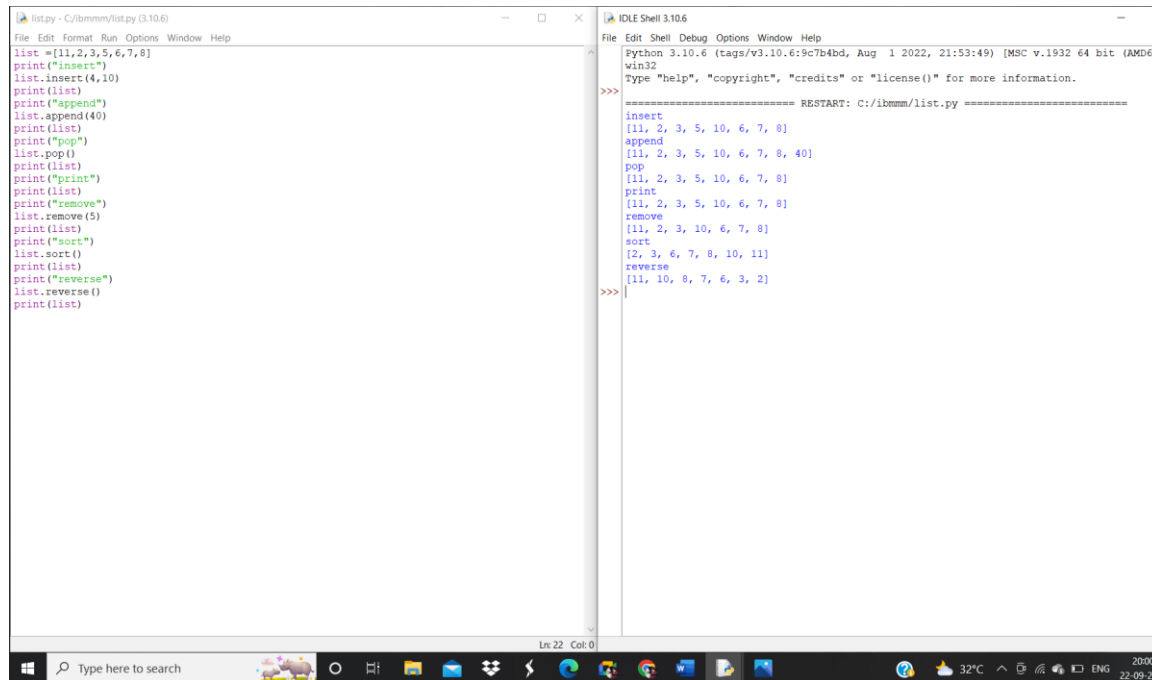

Solution:

```
list=[11,2,3,5,6,7,8]
print("insert")
list.insert(4,10)
print(list)
print("append")
list.append(40)
print(list)
print("pop")
list.pop()
print(list)
print("print")
print(list)
print("remove")
list.remove(5)
print(list)
print("sort")
list.sort()
print(list)
```

```
print("reverse")
```

```
list.reverse()
```

```
print(list)
```

The screenshot shows a Python IDE with two windows. The left window, titled 'list.py - C:/ibmmn/list.py (3.10.6)', contains the following code:

```
list = [11, 2, 3, 5, 6, 7, 8]
print("insert")
list.insert(4, 10)
print(list)
print("append")
list.append(40)
print(list)
print("pop")
list.pop()
print(list)
print("print")
print(list)
print("remove")
list.remove(5)
print(list)
print("sort")
list.sort()
print(list)
print("reverse")
list.reverse()
print(list)
```

The right window, titled 'IDLE Shell 3.10.6', shows the output of the program:

```
Python 3.10.6 (tags/v3.10.6:9c7b4bd, Aug 1 2022, 21:53:49) [MSC v.1932 64 bit (AMD64)]
Type "help", "copyright", "credits" or "license()" for more information.
>>>
===== RESTART: C:/ibmmn/list.py =====
insert
[11, 2, 3, 5, 10, 6, 7, 8]
append
[11, 2, 3, 5, 10, 6, 7, 8, 40]
pop
[11, 2, 3, 5, 10, 6, 7, 8]
print
[11, 2, 3, 5, 10, 6, 7, 8]
remove
[11, 2, 3, 10, 6, 7, 8]
sort
[2, 3, 6, 7, 8, 10, 11]
reverse
[11, 10, 8, 7, 6, 3, 2]
>>>
```

Question-2:

Write a Calculator program in Python?

Solution:

```
def add(x, y):
```

```
    return x + y
```

```
def subtract(x, y):
```

```
    return x - y
```

```
def multiply(x, y):
```

```
    return x * y
```

```
def divide(x, y):
```

```
    return x / y
```

```
print("Select operation.")

print("1.Add")

print("2.Subtract")

print("3.Multiply")

print("4.Divide")

while True:

    choice = input("Enter choice(1/2/3/4): ")

    if choice in ('1', '2', '3', '4'):

        num1 = float(input("Enter first number: "))

        num2 = float(input("Enter second number: "))

        if choice == '1':

            print(num1, "+", num2, "=", add(num1, num2))

        elif choice == '2':

            print(num1, "-", num2, "=", subtract(num1, num2))

        elif choice == '3':

            print(num1, "*", num2, "=", multiply(num1, num2))

        elif choice == '4':

            print(num1, "/", num2, "=", divide(num1, num2))

        next_calculation = input("Let's do next calculation? (yes/no): ")

        if next_calculation == "no":

            break

    else:

        print("Invalid Input")
```

Question-3:

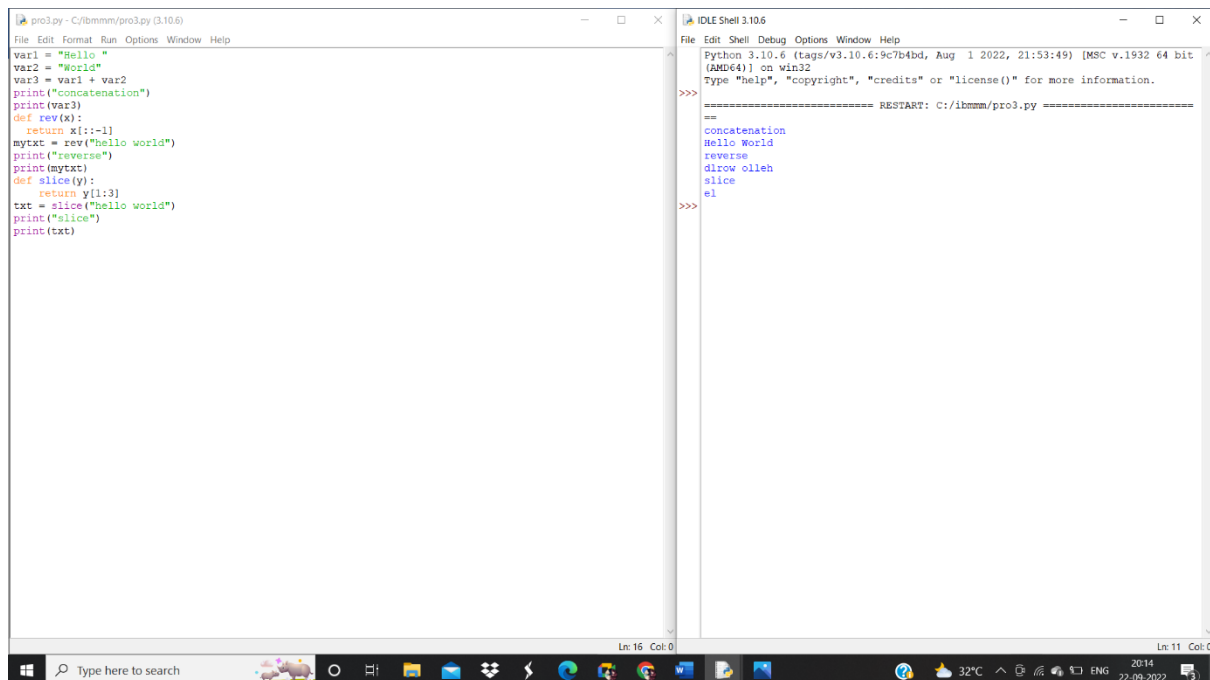

Write a program to concatenate, reverse and slice a string?

Solution:

```
var1 = "Hello "  
var2 = "World"  
var3 = var1 + var2  
print("concatenation")  
print(var3)  
def rev(x):  
    return x[::-1]  
mytxt = rev("hello world")  
print("reverse")  
print(mytxt)  
def slice(y):  
    return y[1:3]  
txt = slice("hello world")
```

```
print("slice")
```

```
print(txt)
```

Question-4:

Why is Python a popular programming language? Full form of WSGI

Due to its ease of learning and usage, Python codes can easily be written and executed much faster than other programming languages. One of the main reasons why Python's popularity has exponentially grown is due to its simplicity in syntax so that it could be easy to read and developed by amateur professionals as well

Question-5:

What are the other Frameworks that can be used with python?

Examples of Python frameworks that support WSGI include Django, CherryPy, Flask, TurboGears, and web2py.

Question-6:

Full form of WSGI

Web Server Gateway Interface
