Assignment -3
Python Programming
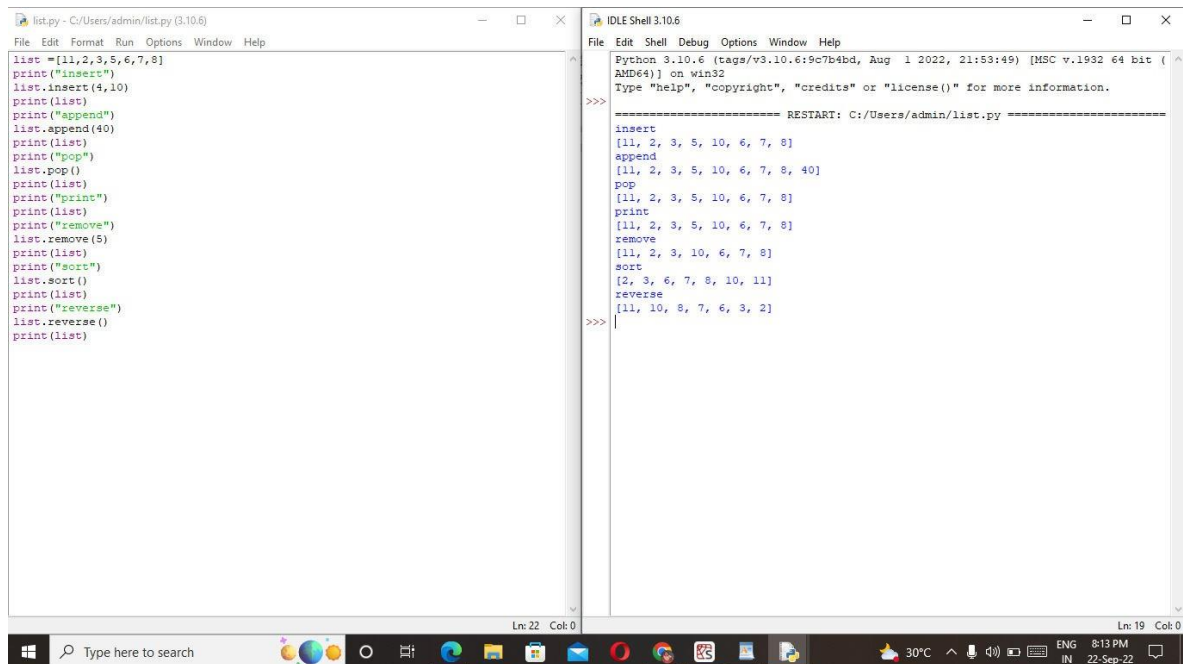

Assignment Date	19 September 2022
Student Name	I.Mukil
Student Roll Number	820419104037
Maximum Marks	2 Marks

Question-1:

Consider a list (list = []). You can perform the following commands: insert i e: Insert integer at position . print: Print the list. remove e: Delete the first occurrence of integer . append e: Insert integer at the end of the list. sort: Sort the list. pop: Pop the last element from the list. reverse: Reverse the list. Initialize your list and read in the value of followed by lines of commands where each command will be of the types listed above. Iterate through each command in order and perform the corresponding operation on your list.

```python
list =[11,2,3,5,6,7,8]

print("insert")

list.insert(4,10)

print(list)

print("append")

list.append(40)

print(list)

print("pop")

list.pop()

print(list)

print("print")

print(list)

print("remove")

list.remove(5)

print(list)

print("sort")

list.sort()

print(list)

print("reverse")

list.reverse()
```

print(list)

Question-2:

Write a Calculator program in Python?

```python
def add(x, y):
    return x + y
def subtract(x, y):
    return x - y
def multiply(x, y):
    return x * y
def divide(x, y):
    return x / y
print("Select operation.")
print("1.Add")
print("2.Subtract")
print("3.Multiply")
print("4.Divide")
while True:
    choice = input("Enter choice(1/2/3/4): ")
    if choice in ('1', '2', '3', '4'):
```

```python
num1 = float(input("Enter first number: "))
num2 = float(input("Enter second number: "))

if choice == '1':
    print(num1, "+", num2, "=", add(num1, num2))

elif choice == '2':
    print(num1, "-", num2, "=", subtract(num1, num2))

elif choice == '3':
    print(num1, "*", num2, "=", multiply(num1, num2))

elif choice == '4':
    print(num1, "/", num2, "=", divide(num1, num2))

next_calculation = input("Let's do next calculation? (yes/no): ")
if next_calculation == "no":
    break

else:
    print("Invalid Input")
```

```python
def add(x, y):
    return x + y
def subtract(x, y):
    return x - y
def multiply(x, y):
    return x * y
def divide(x, y):
    return x / y
print("Select operation.")
print("1.Add")
print("2.Subtract")
print("3.Multiply")
print("4.Divide")
while True:
    choice = input("Enter choice(1/2/3/4): ")
    if choice in ('1', '2', '3', '4'):
        num1 = float(input("Enter first number: "))
        num2 = float(input("Enter second number: "))

        if choice == '1':
            print(num1, "+", num2, "=", add(num1, num2))

        elif choice == '2':
            print(num1, "-", num2, "=", subtract(num1, num2))

        elif choice == '3':
            print(num1, "*", num2, "=", multiply(num1, num2))

        elif choice == '4':
            print(num1, "/", num2, "=", divide(num1, num2))

        next_calculation = input("Let's do next calculation? (yes/no): ")
        if next_calculation == "no":
            break

    else:
        print("Invalid Input")
```
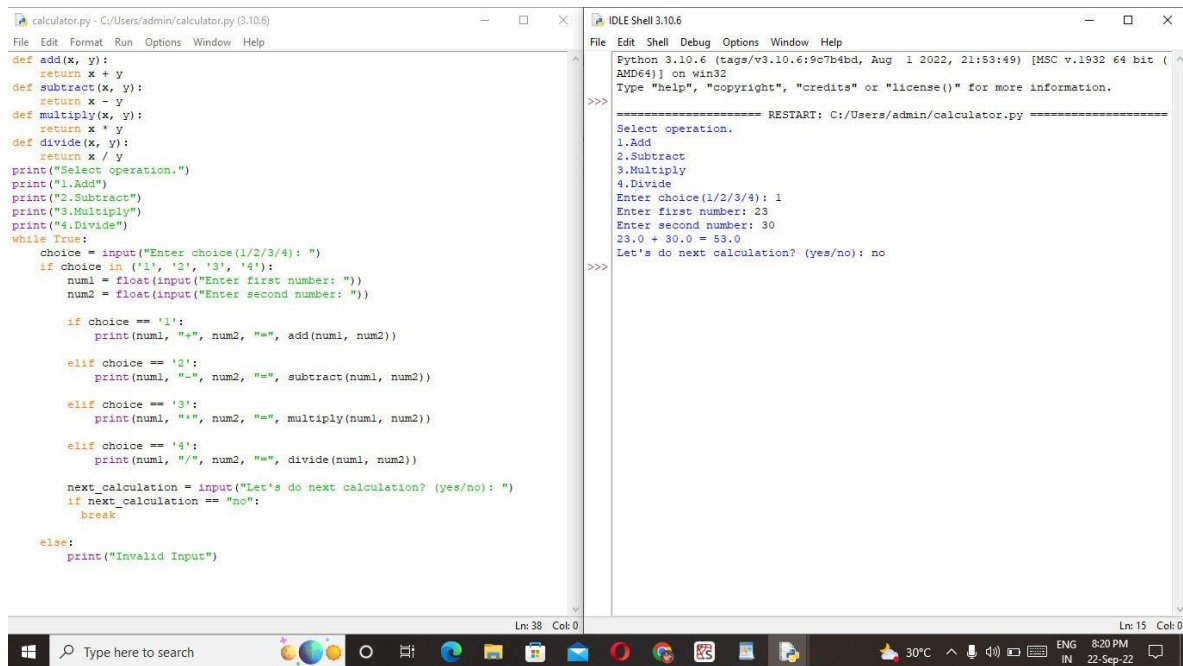

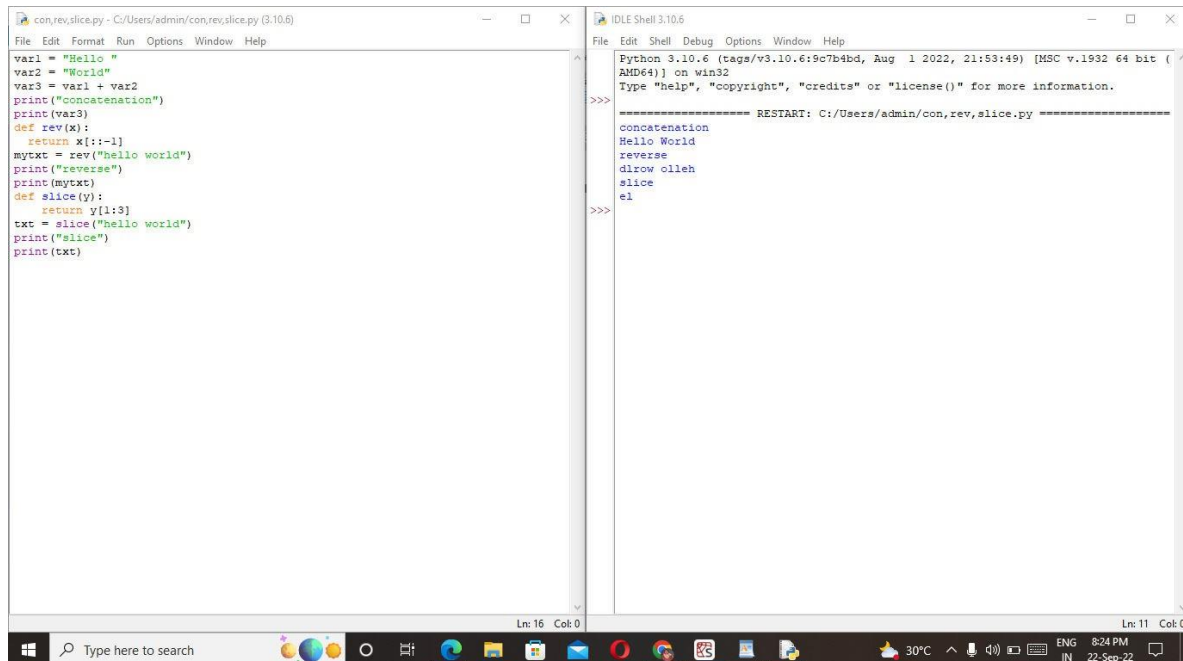

```
Python 3.10.6 (tags/v3.10.6:9c7b4bd, Aug  1 2022, 21:53:49) [MSC v.1932 64 bit (
AMD64)] on win32
Type "help", "copyright", "credits" or "license()" for more information.
>>>
==================== RESTART: C:/Users/admin/calculator.py ====================
Select operation.
1.Add
2.Subtract
3.Multiply
4.Divide
Enter choice(1/2/3/4): 1
Enter first number: 23
Enter second number: 30
23.0 + 30.0 = 53.0
Let's do next calculation? (yes/no): no
>>>
```

Question-3:

Write a program to concatenate, reverse and slice a string?

```python
var1 = "Hello "

var2 = "World"

var3 = var1 + var2

print("concatenation")

print(var3)

def rev(x):

    return x[::-1]

mytxt = rev("hello world")

print("reverse")

print(mytxt)

def slice(y):

    return y[1:3]

txt = slice("hello world")

print("slice")
```

print(txt)

Question-4:

Why is Python a popular programming language?

Due to its ease of learning and usage, Python codes can easily be written and executed much faster than other programming languages. One of the main reasons why Python's popularity has exponentially grown is due to its simplicity in syntax so that it could be easy to read and developed by amateur professionals as well.

Question-5:

What are the other Frameworks that can be used with python?

Examples of Python frameworks that support WSGI include Django, CherryPy, Flask, TurboGears, and web2py.

Question-6:

Full form of WSGI

Web Server Gateway Interface
